

New eco technology brings big savings

CARBON CONTROL Software has launched a new IT package that will significantly reduce companies' carbon footprints, cut energy bills and bring major health and safety benefits.

Its Care Taker suite of applications has been developed in conjunction with both public and private sector organisations to have maximum impact with minimum disruption to productivity.

The software has been proven to reduce computer power use by almost 70 per cent - that's equivalent to £28 per computer and 141Kg of CO₂ each year.

The technology is compatible with existing computer networks and ensures that PCs which are not in use automatically power down.

In line with current health and safety regulations the software encourages employees to take regular breaks away from their PC by displaying a countdown

message when a break is due.

The applications also provide a unique set of reporting options which allows companies to monitor their power use, identify where further savings can be made and use the data as part of wider reporting requirements.

Carbon Control Software has a dedicated and talented team of software engineers who have the experience and ability to provide innovative approaches to energy management software and support clients who are using the system.
